## <u>ABSTRACT</u>

2	The instant invention involves the use of a
3	combination of preparatory steps in conjunction with mass
4	spectroscopy and time-of-flight detection procedures to
5	maximize the diversity of biopolymers which are verifiable
6	within a particular sample. The cohort of biopolymers
7	verified within such a sample is then viewed with
8	reference to their ability to evidence at least one
119	particular disease state; thereby enabling a diagnostician
111	to gain the ability to characterize either the presence or
111	absence of said at least one disease state relative to
12	recognition of the presence and/or the absence of said
±13	biopolymer, predict disease risk assessment, and develop
114	therapeutic avenues against said disease.
